This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: JD Form 1 of 7; SAC 2010-00600-4E I-95 Mega Site

C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   - State: South Carolina
   - County/parish/borough: Dillon
   - City:
   - Center coordinates of site (lat/long in degree decimal format): Lat. 34.406534° N, Long. -79.413387° W.
   - Universal Transverse Mercator:
   - Name of nearest waterbody: Old Mill Creek
   - Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: The aquatic resources (Wetlands "F", "M", "N", "P" and "Q") remain confined within the project boundary and do not flow into a TNW.
   - Name of watershed or Hydrologic Unit Code (HUC): 03040204-04
   - Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.
   - Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):
   - Office (Desk) Determination. Date:
   - Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION.
   - There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]
   - Waters subject to the ebb and flow of the tide.
   - Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
     - Explain: 

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.
   - There are no “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.
   a. Indicate presence of waters of U.S. in review area (check all that apply):  
      - TNWs, including territorial seas
      - Wetlands adjacent to TNWs
      - Relatively permanent waters\(^2\) (RPWs) that flow directly or indirectly into TNWs
      - Non-RPWs that flow directly or indirectly into TNWs
      - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - Impoundments of jurisdictional waters
      - Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area:
      - Non-wetland waters: linear feet: width (ft) and/or acres.
      - Wetlands: acres.

   c. Limits (boundaries) of jurisdiction based on: Pick List, Pick List, Pick List
      - Elevation of established OHWM (if known): N/A.

2. Non-regulated waters/wetlands (check if applicable):\(^3\)
   - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.
     - Explain: Five (5) isolated wetlands, labeled Wetlands "F", "M", "N", "P", and "Q" on the drawing, were assessed within the review area and determined to be non-jurisdictional wetlands. The topographic map depicts these wetlands

---

\(^1\) Boxes checked below shall be supported by completing the appropriate sections in Section III below.

\(^2\) For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).

\(^3\) Supporting documentation is presented in Section III.F.
as forested uplands within the project boundary. A blue line is depicted near Wetland "Q"; however, this blue line was viewed during the site visit and terminates within uplands immediately adjacent to Wetland "Q". The majority of this blue line no longer exists and has been filled in during recent development. This blue line was previously determined to be a non-jurisdictional ditch. A blue line is also depicted within Wetland "F"; however, this blue line also terminates within uplands immediately adjacent to Wetland "F" and does not connect to any potential Waters of the US. No blue lines or other potential Waters of the US are depicted near Wetlands "N", "M", or "P". The aerals depict all five wetlands as forested with no potential linear features within or adjacent to the boundary of the wetlands except Isolated Wetland "Q", which has a linear feature exiting it. This linear feature was observed during the site visit and determined to no longer exist immediately north of this wetland. The NWIs depict Wetlands "M", "N", and "P" as uplands (U42P), and the soil survey maps these wetlands as Smithboro, which is partially hydric. Wetland "F" is mapped as palustrine forested wetlands (PFO4Bd) on the NWIs and as Persanti, a partially hydric soil, on the soil survey. Wetland "Q" is mapped Coxville, a hydric soil, on the soil survey, and as wetlands on the NWIs (PFO4Ad). These forested freshwater wetlands were viewed during the site visit and determined to be completely surrounded by uplands. No surface or shallow subsurface connections from Wetlands "F", "M", "N", "P", and "Q" to any Waters of the US (WOUS) were viewed during the site visit. A review of a jurisdictional determination completed on this site (SAC 2010-00600, letter dated May 4, 2011) previously determined that Wetlands "F", "M", "N", and "P" are isolated. 

These depressional wetlands exhibited hydric soils, hydrophytic vegetation, and indicators of hydrology, which satisfied the criteria set forth in the 1987 Wetland Delineation Manual and the Atlantic and Gulf Coastal Plain Regional Supplement. All water located within or draining toward these wetlands had no discernible or traceable outfall or connection to any WOUS. Additionally, these wetlands were found to be completely surrounded by forested uplands which further disrupts possible connections to any WOUS. Chemically, these wetlands do not affect any WOUS in the absorption/treatment of nutrients, runoff, or pollutants. Physically, the topographic location of these wetlands is such that water in the wetlands is retained and eventually percolates through the soil to groundwater only, at an unknown depth, providing little if any stormwater attenuation. Biologically, these wetlands are not essential in providing organic carbon in the form of their collective primary productivity to downstream waters, resulting in the nourishment of the downstream food web. Because of the lack of discernible outfall, topography grades and lack of evidence of chemical, physical, or biological connection, Wetlands "F", "M", "N", "P" and "Q" were determined to be isolated, non-jurisdictional wetlands.

Several ponds were assessed within the review area and determined to be excavated out of uplands. These ponds total 0.93 acre on site and were determined to be non-jurisdictional.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: .
   Summarize rationale supporting determination: .

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is “adjacent”: .

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody\(^4\) is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed size: Pick List ;
      Drainage area: Pick List
      Average annual rainfall: inches
      Average annual snowfall: inches

   (ii) Physical Characteristics:
      (a) Relationship with TNW:
         □ Tributary flows directly into TNW.
         □ Tributary flows through Pick List tributaries before entering TNW.
      Project waters are Pick List river miles from TNW.
      Project waters are Pick List river miles from RPW.
      Project waters are Pick List aerial (straight) miles from TNW.
      Project waters are Pick List aerial (straight) miles from RPW.
      Project waters cross or serve as state boundaries. Explain: N/A.
      Identify flow route to TNW\(^5\): .
      Tributary stream order, if known: .

---

\(^4\) Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

\(^5\) Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.
(b) General Tributary Characteristics (check all that apply):

- **Tributary** is: □ Natural  □ Artificial (man-made). Explain:  □ Manipulated (man-altered). Explain:  

- **Tributary properties with respect to top of bank (estimate):**
  - Average width: __ feet
  - Average depth: __ feet
  - Average side slopes: **Pick List.**

- Primary tributary substrate composition (check all that apply):
  - □ Silts  □ Sands  □ Concrete
  - □ Cobbles  □ Gravel  □ Muck
  - □ Bedrock  □ Vegetation. Type/% cover:  □ Other. Explain:  

- Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain:  □ Presence of run/riffle/pool complexes. Explain:  

- **Tributary geometry: ** **Pick List.**
  - **Tributary gradient (approximate average slope): ** %

(c) Flow:

- **Tributary provides for:** **Pick List**
  - Estimate average number of flow events in review area/year: **Pick List**
  - Describe flow regime:  
  - Other information on duration and volume:  

- **Surface flow is: ** **Pick List.** Characteristics:  
  - □ Dye (or other) test performed:  

- **Subsurface flow: ** **Pick List.** Explain findings:  
  - □ Dye (or other) test performed:  

- **Tributary has (check all that apply):**
  - □ Bed and banks
  - □ OHWM\(^6\) (check all indicators that apply):
    - clear, natural line impressed on the bank
    - changes in the character of soil
    - shelving
    - vegetation matted down, bent, or absent
    - leaf litter disturbed or washed away
    - sediment deposition
    - water staining
    - other (list):  
  - □ Discontinuous OHWM.\(^7\) Explain:  

- If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):
  - □ High Tide Line indicated by:  □ Mean High Water Mark indicated by:
    - oil or scum line along shore objects
    - fine shell or debris deposits (foreshore)
    - physical markings/characteristics
    - tidal gauges
    - other (list):  

(ii) **Chemical Characteristics:**
  - Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).
  - Explain:  
  - Identify specific pollutants, if known:  

---

\(^6\)A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.  

\(^7\)Ibid.
(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width): .
- Habitat for:
  - Federally Listed species. Explain findings: .
  - Fish/spawn areas. Explain findings: .
  - Other environmentally-sensitive species. Explain findings: .
  - Aquatic/wildlife diversity. Explain findings: .

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
  Properties:
  - Wetland size: acres
  - Wetland type. Explain: .
  Project wetlands cross or serve as state boundaries. Explain: .

(b) General Flow Relationship with Non-TNW:
  Flow is: Pick List. Explain: .
  Surface flow is: Pick List
  Characteristics: .
  Subsurface flow: Pick List. Explain findings: .
  Dye (or other) test performed: .

(c) Wetland Adjacency Determination with Non-TNW:
  - Directly abutting
  - Not directly abutting
    - Discrete wetland hydrologic connection. Explain: .
    - Separated by berm/barrier. Explain: .

(d) Proximity (Relationship) to TNW:
  Project wetlands are Pick List river miles from TNW.
  Project waters are Pick List aerial (straight) miles from TNW.
  Flow is from: Pick List.
  Estimate approximate location of wetland as within the Pick List floodplain.

(ii) Chemical Characteristics:
  Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: .
  Identify specific pollutants, if known: .

(iii) Biological Characteristics. Wetland supports (check all that apply):
  - Riparian buffer. Characteristics (type, average width): .
  - Vegetation type/percent cover. Explain: .
  - Habitat for:
    - Federally Listed species. Explain findings: .
    - Fish/spawn areas. Explain findings: .
    - Other environmentally-sensitive species. Explain findings: .
    - Aquatic/wildlife diversity. Explain findings: .

3. Characteristics of all wetlands adjacent to the tributary (if any)
  All wetland(s) being considered in the cumulative analysis: Pick List
  Approximately ( ) acres in total are being considered in the cumulative analysis.
For each wetland, specify the following:

- Directly abuts? (Y/N)
- Size (in acres)
- Directly abuts? (Y/N)
- Size (in acres)

Summarize overall biological, chemical and physical functions being performed: .

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), Or, acres.
   - Wetlands adjacent to TNWs: acres.

2. **RPWs that flow directly or indirectly into TNWs.**
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: .

Page 6 of 9
Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters:

3. Non-RPWs that flow directly or indirectly into TNWs.
- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional waters within the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands directly abutting an RPW and thus are jurisdictional as adjacent wetlands.
- Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
- Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters.8

As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
- Demonstrate that impoundment was created from “waters of the U.S.,” or
- Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain:

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):10
- which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain: .
- Other factors. Explain: .

---

8 See Footnote # 3.
9 To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
10 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
Identify water body and summarize rationale supporting determination: 

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters: linear feet width (ft).
☐ Other non-wetland waters: acres.
☐ Identify type(s) of waters: .
☐ Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):

☐ If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
☐ Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
☐ Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
☐ Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain: .
☐ Other: (explain, if not covered above): .

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
☐ Lakes/ponds: acres.
☐ Other non-wetland waters: acres. List type of aquatic resource: .
☐ Wetlands: (Wetland "F") 1.41 a. + (Wetland "M") 0.29 a. + (Wetland "N") 0.59 a. + (Wetland "P") 0.35 a. + (Wetland "Q") 0.15 a. = 2.79 acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
☐ Lakes/ponds: acres.
☐ Other non-wetland waters: acres. List type of aquatic resource: .
☐ Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc., plat by Survey One, LLC.
☐ Data sheets prepared/submitted by or on behalf of the applicant/consultant.
☐ Office concurs with data sheets/delineation report.
☐ Office does not concur with data sheets/delineation report.
☐ Data sheets prepared by the Corps: .
☐ Corps navigable waters’ study: .
☐ USGS NHD data.
☐ USGS 8 and 12 digit HUC maps.
☐ U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts these wetlands as forested uplands.
☐ USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps Wetland "F" as Persanti, a partially hydric soil, and Wetland "Q" as Coxville, a hydric soil. Wetlands "M", "N", and "P" are mapped Smithboro, which is partially hydric.
☐ National wetlands inventory map(s). Cite name: U42P, PFO4Ad, and PFO4Bd; The NWIs depict Wetlands "M", "N", and "P" as forested uplands. Wetlands "F" and "Q" are mapped palustrine forested wetlands.
☐ State/Local wetland inventory map(s): .
☐ FEMA/FIRM maps: .
☐ 100-year Floodplain Elevation is: (National Geodetic Vertical Datum of 1929)
☐ Photographs: ☑ Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the wetlands as forested.
☐ Other (Name & Date): Site photos provided by S&ME, Inc.
☐ Previous determination(s). File no. and date of response letter: SAC 2010-00600-4E; letter dated May 4, 2011.
☐ Applicable/supporting case law: .
☐ Applicable/supporting scientific literature: .
☐ Other information (please specify): .
B. ADDITIONAL COMMENTS TO SUPPORT JD: Five (5) isolated wetlands, labeled Wetlands "F", "M", "N", "P", and "Q" on the drawing, were assessed within the review area and determined to be non-jurisdictional wetlands. The topographic map depicts these wetlands as forested uplands within the project boundary. A blue line is depicted near Wetland "Q"; however, this blue line was viewed during the site visit and terminates within uplands immediately adjacent to Wetland "Q". The majority of this blue line no longer exists and has been filled in during recent development. This blue line was previously determined to be a non-jurisdictional ditch. A blue line is also depicted within Wetland "F"; however, this blue line also terminates within uplands immediately adjacent to Wetland "F" and does not connect to any potential Waters of the US. No blue lines or other potential Waters of the US are depicted near Wetlands "N", "M", or "P". The aerials depict all five wetlands as forested with no potential linear features within or adjacent to the boundary of the wetlands except Isolated Wetland "Q", which has a linear feature exiting it. This linear feature was observed during the site visit and determined to no longer exist immediately north of this wetland. The NWIs depict Wetlands "M", "N", and "P" as uplands (U42P), and the soil survey maps these wetlands as Smithboro, which is partially hydric. Wetland "F" is mapped as palustrine forested wetlands (PFO4Bd) on the NWIs and as Persanti, a partially hydric soil, on the soil survey. Wetland "Q" is mapped Coxville, a hydric soil, on the soil survey, and as wetlands on the NWIs (PFO4Ad). These forested freshwater wetlands were viewed during the site visit and determined to be completely surrounded by uplands. No surface or shallow subsurface connections from Wetlands "F", "M", "N", "P", and "Q" to any Waters of the US (WOUS) were viewed during the site visit. A review of a jurisdictional determination completed on this site (SAC 2010-00600, letter dated May 4, 2011) previously determined that Wetlands "F", "M", "N", and "P" are isolated.
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016
B. DISTRICT OFFICE, FILE NAME, AND NUMBER: JD Form 2 of 7; SAC 2010-00600-4E I-95 Mega Site
C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   State: South Carolina  County/parish/borough: Dillon  City:  
   Center coordinates of site (lat/long in degree decimal format): Lat. 34.406534° N, Long. -79.413387° W.  
   Universal Transverse Mercator:
   Name of nearest waterbody: Old Mill Creek  
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River  
   Name of watershed or Hydrologic Unit Code (HUC): 03040204-04  
   Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.  
   Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.
D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):
   Office (Desk) Determination. Date:  
   Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION.
   There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]  
   Waters subject to the ebb and flow of the tide.  
   Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain:  
B. CWA SECTION 404 DETERMINATION OF JURISDICTION.
   There are “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]  
   1. Waters of the U.S.
      a. Indicate presence of waters of U.S. in review area (check all that apply):  
         ,  
      b. Identify (estimate) size of waters of the U.S. in the review area:  
         Non-wetland waters: linear feet: width (ft) and/or 0.48 a. (pRPW Tributary #1) + 1.93 a. (Impoundment of WOUS) = 2.41 acres.  
         Wetlands: acres.  
      c. Limits (boundaries) of jurisdiction based on: Established by OHWM.,  Pick List  Pick List  
         Elevation of established OHWM (if known): N/A.
   2. Non-regulated waters/wetlands (check if applicable):  
      Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.  
      Explain:  

---

1 Boxes checked below shall be supported by completing the appropriate sections in Section III below.
2 For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).
3 Supporting documentation is presented in Section III.F.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1 only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: Little Pee Dee River.
   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:
   Watershed size: Pick List ;
   Drainage area: Pick List
   Average annual rainfall: inches
   Average annual snowfall: inches

(ii) Physical Characteristics:
   (a) Relationship with TNW:
      [ ] Tributary flows directly into TNW.
      [ ] Tributary flows through Pick List tributaries before entering TNW.
      Project waters are Pick List river miles from TNW.
      Project waters are Pick List river miles from RPW.
      Project waters are Pick List aerial (straight) miles from TNW.
      Project waters are Pick List aerial (straight) miles from RPW.
      Project waters cross or serve as state boundaries. Explain: N/A.

   Identify flow route to TNW:\n
---

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.
5 Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

Page 2 of 8
(b) General Tributary Characteristics (check all that apply):

- **Tributary**
  - Natural
  - Artificial (man-made). Explain:
  - Manipulated (man-altered). Explain:

**Tributary** properties with respect to top of bank (estimate):

- Average width: feet
- Average depth: feet
- Average side slopes: Pick List.

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Cobble
- Gravel
- Bedrock
- Vegetation. Type/% cover:
- Concrete
- Muck
- Other. Explain:

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain:

Presence of run/riffle/pool complexes. Explain:

**Tributary geometry**: Pick List. Explain:

Tributary gradient (approximate average slope): %

(c) Flow:

- **Tributary provides for**: Pick List
- Estimate average number of flow events in review area/year: Pick List
- Describe flow regime:
- Other information on duration and volume:

**Surface flow is**: Pick List. Characteristics:

**Subsurface flow**: Pick List. Explain findings:

- Dye (or other) test performed:

**Tributary has** (check all that apply):

- Bed and banks
- **OHWM** (check all indicators that apply):
  - clear, natural line impressed on the bank
  - changes in the character of soil
  - shelving
  - vegetation matted down, bent, or absent
  - leaf litter disturbed or washed away
  - sediment deposition
  - water staining
  - other (list):

- Discontinuous **OHWM**. Explain:

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):

- High Tide Line indicated by:
- Mean High Water Mark indicated by:

**Chemical Characteristics**:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).

Identify specific pollutants, if known:

---

6A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

7Ibid.
*iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width): .
- Habitat for:
  - Federally Listed species. Explain findings: .
  - Fish/spawn areas. Explain findings: .
  - Other environmentally-sensitive species. Explain findings: .
- Aquatic/wildlife diversity. Explain findings: .

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
   (a) General Wetland Characteristics:
      Properties:
      - Wetland size: acres
      - Wetland type. Explain: .
      Project wetlands cross or serve as state boundaries. Explain: .

   (b) General Flow Relationship with Non-TNW:
      Flow is: **Pick List**. Explain: .
      Surface flow is: **Pick List**. Characteristics: .
      Subsurface flow: **Pick List**. Explain findings: .
      Dye (or other) test performed: .

   (c) Wetland Adjacency Determination with Non-TNW:
      - Directly abutting
      - Not directly abutting
        - Discrete wetland hydrologic connection. Explain: .
        - Separated by berm/barrier. Explain: .

   (d) Proximity (Relationship) to TNW:
      Project wetlands are **Pick List** river miles from TNW.
      Project waters are **Pick List** aerial (straight) miles from TNW.
      Flow is from: **Pick List**.
      Estimate approximate location of wetland as within the **Pick List** floodplain.

(ii) Chemical Characteristics:
      Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: .
      Identify specific pollutants, if known: .

(iii) Biological Characteristics. Wetland supports (check all that apply):
      - Riparian buffer. Characteristics (type, average width): .
      - Vegetation type/percent cover. Explain: .
      - Habitat for:
        - Federally Listed species. Explain findings: .
        - Fish/spawn areas. Explain findings: .
        - Other environmentally-sensitive species. Explain findings: .
        - Aquatic/wildlife diversity. Explain findings: .

3. Characteristics of all wetlands adjacent to the tributary (if any)
   All wetland(s) being considered in the cumulative analysis: **Pick List**
   Approximately ( ) acres in total are being considered in the cumulative analysis.
For each wetland, specify the following:

<table>
<thead>
<tr>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Summarize overall biological, chemical and physical functions being performed:

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), Or, acres.
   - Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs.
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The tributary named "pRPW Tributary #1 was determined to have perennial flow based on a
review of the aerials and topographic map and a site visit. The pRPW #1 is a man-made tributary that is approximately 10' wide at the upstream end and 20' wide at the downstream end. It is depicted on the aerials and on the topographic map as a solid blue line. The pRPW #1 was determined during the site visit to have perennial flow based on the presence of an OHWM, defined bed and banks, water flowing in the channel and a lack of vegetation growing in the bottom of the tributary. This tributary continues flowing south where it enters an impoundment of WOUS. The impoundment continues south where it enters a concrete culvert and then flows into another perennial RPW named pRPW Tributary #2 on the plat.

Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: .

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: 607 linear feet 10-20 width (ft).
- Other non-wetland waters: acres.
Identify type(s) of waters: .

3. Non-RPWs that flow directly or indirectly into TNWs.
- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide estimates for jurisdictional waters within the review area (check all that apply):
  - Tributary waters: linear feet width (ft).
  - Other non-wetland waters: acres.
  Identify type(s) of waters: .

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: .

  - Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: .
  Provide acreage estimates for jurisdictional wetlands in the review area: acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetlands in the review area: acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
- Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters.\(^8\)
As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.

- Demonstrate that impoundment was created from “waters of the U.S.,” or
- Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain: The man-made Impoundment of WOUS (1.93 a.) was created by damming the Jurisdictional pRPW Tributary #1.

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):\(^{10}\)

\(^{8}\)See Footnote # 3.
\(^{9}\)To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
Identify water body and summarize rationale supporting determination:

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource:
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource:
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):
- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps.
- Corps navigable waters’ study.
- USGS NHD data.
- USGS 8 and 12 digit HUC maps.
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the perennial RPW #1 as a solid blue line. The impoundment is not depicted on the topographic map.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the pRPW #1 and Impoundment of WOUS as Coxville, a hydric soil.
- National wetlands inventory map(s). Cite name: The NWIs map the tributary as uplands (U42) and the impoundment as palustrine forested wetlands (PFO1Ad and PFO4Ad).
- State/Local wetland inventory map(s).
- FEMA/FIRM maps.
- 100-year Floodplain Elevation is: (National Geodectic Vertical Datum of 1929)

Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
Photographs: ☒ Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the pRPW #1 as a blue linear feature that is located upstream of a man-made impoundment.

or ☒ Other (Name & Date): Site photos provided by S&ME, Inc.

Previous determination(s). File no. and date of response letter: SAC 2010-00600-4E; letter dated May 4, 2011.

Applicable/supporting case law: .

Applicable/supporting scientific literature: .

Other information (please specify): .

B. ADDITIONAL COMMENTS TO SUPPORT JD: The tributary named "pRPW Tributary #1 was determined to have perennial flow based on a review of the aerials and topographic map and a site visit. The pRPW #1 is a man-made tributary that is approximately 10' wide at the upstream end and 20' wide at the downstream end. It is depicted on the aerials and on the topographic map as a solid blue line. The pRPW #1 was determined during the site visit to have perennial flow based on the presence of an OHWM, defined bed and banks, water flowing in the channel and a lack of vegetation growing in the bottom of the tributary. This tributary continues flowing south where it enters an impoundment of WOUS. This man-made impoundment (1.93 a.) was created by damming the pRPW #1. The impoundment continues south where it enters a concrete culvert and then flows into another perennial RPW named pRPW Tributary #2 on the plat.
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: JD Form 3 of 7; SAC 2010-00600-4E I-95 Mega Site

C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   State: South Carolina  County/parish/borough: Dillon  City:  
   Center coordinates of site (lat/long in degree decimal format): Lat. 34.406534° N, Long. -79.413387° W.  
   Universal Transverse Mercator:  
   Name of nearest waterbody: Old Mill Creek  
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River  
   Name of watershed or Hydrologic Unit Code (HUC): 03040204-04  
   Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.  
   Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):
   Office (Desk) Determination. Date:  
   Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. 

[Required]
   Waters subject to the ebb and flow of the tide.  
   Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.  
   Explain: .

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There are “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. 

[Required]

1. Waters of the U.S.
   a. Indicate presence of waters of U.S. in review area (check all that apply):  
   
   [ ] TNWs, including territorial seas  
   [ ] Wetlands adjacent to TNWs  
   [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   [ ] Non-RPWs that flow directly or indirectly into TNWs  
   [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
   [ ] Impoundments of jurisdictional waters  
   [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area:  
      Non-wetland waters: 3504 linear feet: 10-20" width (ft) and/or 1.39 (pRPW #2) acres.  
      Wetlands: 12.24 a. (Wetland "A") + 6.43 a. (Wetland "B") + 3.91 a. (Wetland "C") + 0.25 a. (Wetland "D") + 36.16 a. (Wetland "E") +0.26 a. (Wetland "G") + 1.72 a. (Wetland "H") + 9.09 a. (Wetland "I") = 70.06 acres.

   c. Limits (boundaries) of jurisdiction based on: Established by OHWM. 1987 Delineation Manual, Pick List  
      Elevation of established OHWM (if known):N/A.

2. Non-regulated waters/wetlands (check if applicable):  
   [ ] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.  
   Explain: A non-jurisdictional ditch was assessed within the review area and determined to be a man-made ditch located adjacent to agricultural fields that has less than seasonal flow. This ditch provides a direct hydrologic connection for

---

1 Boxes checked below shall be supported by completing the appropriate sections in Section III below.  
2 For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).  
3 Supporting documentation is presented in Section III.F.
Wetlands "G", "H", and "I" to the downstream perennial RPW. This non-jurisdictional ditch was determined to have less than seasonal flow based on the presence of water-stained leaf litter and debris, muck in the streambed and no defined channel. The flow in this non-jurisdictional ditch has been altered due to the presence of several beaver dams in the downstream perennial RPW (labeled pRPW #2 on the plat), which has altered the water table. This non-jurisdictional ditch directly abuts three jurisdictional wetlands and intercepts groundwater downstream of Wetland "I"; however, no flow indicators are present due to the downstream impoundments.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: Little Pee Dee River.

   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed size: 97,495 acres; HUC 03040204-04 - Buck Swamp
   - Drainage area: 4210 acres
   - Average annual rainfall: 47.05 inches
   - Average annual snowfall: 1.7 inches

   (ii) Physical Characteristics:
   - Relationship with TNW:
     - □ Tributary flows directly into TNW.
     - ☑ Tributary flows through 2 tributaries before entering TNW.

     Project waters are 20-25 river miles from TNW.
     Project waters are 1 (or less) river miles from RPW.
     Project waters are 15-20 aerial (straight) miles from TNW.
     Project waters are 1 (or less) aerial (straight) miles from RPW.
     Project waters cross or serve as state boundaries. Explain: N/A.

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.
Identify flow route to TNW: The pRPW #2, named Old Mill Creek, flows directly into Reedy Creek, a PRPW. Reedy Creek flows into Buck Swamp, a PRPW, before flowing into the Little Pee Dee River, a TNW. Tributary stream order, if known: The pRPW #2 is a 1st order stream that originates immediately north of the site within Betsy Johnson Bay.

(b) General Tributary Characteristics (check all that apply):

- Tributary is: Natural
- Artificial (man-made). Explain: 
- Manipulated (man-altered). Explain: The majority of the tributary is natural; however, portions of the tributary have been dammed by beaver activity.

Tributary properties with respect to top of bank (estimate):
- Average width: 15 feet
- Average depth: 4-6 feet
- Average side slopes: Vertical (1:1 or less).

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Cobble
- Gravel
- Bedrock
- Muck
- Other. Explain: 

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: The tributary is relatively stable with no erosion or sloughing observed.

Presence of run/riffle/pool complexes. Explain: No run/riffle/pool complexes were observed.

Tributary geometry: Meandering.

Tributary gradient (approximate average slope): %

(c) Flow:

- Tributary provides for: Perennial flow
- Estimate average number of flow events in review area/year: 20 (or greater)

Describe flow regime: This tributary receives flow from the upstream, on-site, and downstream wetlands via overland sheetflow and from the non-jurisdictional ditches that receive water from adjacent uplands.

Other information on duration and volume: Flowing water was observed during the original site visit on August 2, 2010, and during the second site visit on February 3, 2016.

- Surface flow is: Discrete and confined. Characteristics: 
- Subsurface flow: Unknown. Explain findings: 
- Dye (or other) test performed: 

Tributary has (check all that apply):
- Bed and banks
- OHWM\(^6\) (check all indicators that apply):
  - clear, natural line impressed on the bank
  - changes in the character of soil
  - shelving
  - vegetation matted down, bent, or absent
  - leaf litter disturbed or washed away
  - sediment deposition
  - water staining
  - other (list): 
  - the presence of litter and debris
  - destruction of terrestrial vegetation
  - the presence of wrack line
  - sediment sorting
  - scour
  - multiple observed or predicted flow events
  - abrupt change in plant community

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):
- High Tide Line indicated by:
- Mean High Water Mark indicated by:
  - oil or scum line along shore objects
  - fine shell or debris deposits (foreshore)
  - physical markings/characteristics
  - tidal gauges
  - other (list): 

---

\(^5\) Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

\(^6\) A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

\(^7\) Ibid.
(iii) Chemical Characteristics:
Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).
Explain: The tributary has a firm sandy bottom with clear water typical of the blackwater tributaries in this watershed. This tributary is located within the Buck Swamp Watershed, which consists of approximately 43% agricultural land and 25% forested wetland. Additional land uses in this watershed consist of forested land, urban land, scrub/shrub land, non-forested wetlands, and water. According to SCDHEC, a review of the downstream monitoring station for Buck Swamp (PD-031) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

(iv) Biological Characteristics.
Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width): Forested, 10-100' wide.
- Wetland fringe. Characteristics: The perennial RPW directly abuts Wetlands "A", "B", "C", and "E" on site as well as additional wetlands located upstream and downstream of the project site.
- Habitat for:
  - Federally Listed species. Explain findings: .
  - Fish/spawn areas. Explain findings: .
  - Other environmentally-sensitive species. Explain findings: .
- Aquatic/wildlife diversity. Explain findings: This perennial RPW provides an important habitat and corridor for wildlife as well as a connection to the downstream TNW for aquatic species.

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
Properties:
  - Wetland size: 12.24 a. (Wetland "A") + 6.43 a. (Wetland "B") + 3.91 a. (Wetland "C") + 0.25 a. (Wetland "D") + 36.16 a. (Wetland "E") + 0.26 a. (Wetland "G") + 1.72 a. (Wetland "H") + 9.09 a. (Wetland "I") = 70.06 acres
  - Wetland type. Explain: Palustrine forested.
  - Wetland quality. Explain: The wetlands on site were determined to be fully functional.
Project wetlands cross or serve as state boundaries. Explain: N/A.
(b) General Flow Relationship with Non-TNW:
Flow is: Intermittent flow. Explain: .
Surface flow is: Overland sheetflow. Explain: .
Subsurface flow: Unknown. Explain findings: .
Dye (or other) test performed: .
(c) Wetland Adjacency Determination with Non-TNW:
- Directly abutting
- Not directly abutting
- Discrete wetland hydrologic connection. Explain: Wetlands "G", "H", and "I" are all connected to the downstream perennial RPW via non-jurisdictional ditches. Although these ditches were found to have less than seasonal flow during the site visit, they provide a direct hydrological connection for these four wetlands to the downstream perennial RPW.
- Ecological connection. Explain: Based on the aerials and soil survey, Wetland "D" is a portion of a pre-existing wetland that was impacted by the excavation of a tributary named perennial RPW #3 on the plat. This tributary is not depicted on the 1999 aerials and created a man-made barrier between Wetland "D" and the perennial RPW. Wetland "D" is located adjacent to the intersection of pRPW #3 and pRPW #2.
(d) Proximity (Relationship) to TNW
Project wetlands are 20-25 river miles from TNW.
Project waters are 15-20 aerial (straight) miles from TNW.
Flow is from: Wetland to navigable waters.
Estimate approximate location of wetland as within the 100 - 500-year floodplain.
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: These wetlands are fully functional and seasonally saturated. Wetland "E" and the downstream wetland system have been influenced by beaver dams within the perennial RPW and are seasonally inundated. This watershed is approximately 43% agricultural land and 25% forested wetland. Additional land uses consist of forested land, urban land, scrub/shrub land, non-forested wetland, and water.
Identify specific pollutants, if known: According to SCDHEC, a review of the downstream monitoring station for Buck Swamp (PD-031) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

(iii) Biological Characteristics. Wetland supports (check all that apply):
- ☒ Vegetation type/percent cover. Explain: Liquidambar styraciflua (FAC), Acer rubrum (FAC), Persea borbonia (FACW), Pinus taeda (FAC), Quercus phellos (FACW), and Quercus nigra (FAC).
- ☐ Habitat for:
  - ☐ Federally Listed species. Explain findings:  .
  - ☐ Fish/spawn areas. Explain findings:  .
  - ☐ Other environmentally-sensitive species. Explain findings:  .
  - ☐ Aquatic/wildlife diversity. Explain findings:  .

3. Characteristics of all wetlands adjacent to the tributary (if any)
   All wetland(s) being considered in the cumulative analysis:  11
   Approximately (500) acres in total are being considered in the cumulative analysis.

   For each wetland, specify the following:
   
<table>
<thead>
<tr>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>

   Summarize overall biological, chemical and physical functions being performed: The perennial RPW named Old Mill Creek and the approximately 500 acres of wetlands located adjacent to this perennial RPW contribute vital biological, chemical, and physical functions to the downstream TNW. These wetlands and the adjacent pRPW make up an important ecological system with vital aquatic habitat that supports an abundance of wildlife in a watershed that consists predominately of agricultural fields. This area is also located adjacent to US Interstate 95 and southwest of the City of Dillon, which is an area that has a moderate rate of growth and the majority of the industrial land in this county. Due to the prevalence of agriculture land use in this watershed and the nearby development outside of the city limits, these wetlands and the adjacent pRPW are acting as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amount of flood waters reaching the downstream TNW.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?
Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D: .

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The perennial RPW named Old Mill Creek and the nonabutting wetlands labeled Wetlands "D", "G", "H", and "I" contribute vital biological, chemical, and physical functions to the downstream TNW. The four wetlands all provide important aquatic habitat used for feeding, nesting, and other functions that support wildlife within uplands that are predominately in use as ag. fields. These wetlands also act as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amounts of flood waters that can reach the downstream TNW. Wetland "D" is separated from the perennial RPW by a man-made berm and Wetlands "G", "H", and "I" have a direct hydrologic connection to the downstream perennial RPW via non-jurisdictional ditches. Because of these connections, these wetlands have the capacity to transfer nutrients to the downstream pRPW that provide support to the aquatic wildlife in the perennial RPW and the downstream TNW. Due to the prevalence of agriculture land use in this watershed and the potential for industrial development on this site, these wetlands are a vital part of the perennial RPW's 4210 acre drainage area and were determined to have a significant nexus to the downstream TNW.

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), acres.
   - Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs. Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The tributary named perennial RPW #2 on the survey plat was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict a linear feature indicative of a tributary and the topographic map depicts this tributary as a solid blue line, which usually indicates perennial flow. This tributary is named Old Mill Creek. The site visit shows this tributary has indicators of perennial flow including a defined OHWM, a channel within bed and banks, a firm, sandy bottom of the channel, a lack of leaf litter and debris in the channel, and flowing water observed. This pRPW receives flow upstream (off site) from a large wetland system named "Betsy Johnson Bay" on the topo map and receives flow on site from abutting and non-abutting wetlands as well as a non-jurisdictional ditch. The downstream portion of pRPW #2 has been impounded by beaver dams, located off site, and no OHWM or defined channel was observed upstream of the beaver dams at the southern end of the site, labeled Wetland "E" on the plat. Downstream of the beaver dams, the topographic map depicts this tributary as flowing directly into Reedy Creek, a pRPW, and then into Buck Swamp, pRPW, prior to flowing in to the Little Pee Dee River (a TNW).
   - Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: .
   - Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters: 3504 linear feet 15-20 width (ft).
     - Other non-wetland waters: acres.
   - Identify type(s) of waters: .

3. Non-RPWs* that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide estimates for jurisdictional waters within the review area (check all that apply):
   - Tributary waters: linear feet width (ft).

*See Footnote # 3.
4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - Wetlands directly abutting an RPW and thus are jurisdictional as adjacent wetlands.
   - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: Based on the review of aerals, topographic maps, soil survey, NWIs and a site visit, Wetlands "A", "B", "C", and "E" are portions of a larger wetland system that directly abuts the perennial RPW named Old Mill Creek. These wetlands have been man-altered; however, the topographic map depicts a solid blue line intersecting the wetland areas. The NWI depicts these areas as wetlands (PSS1Ad, PF01Ad, PF04Ad, PF01Fh), and the soil survey maps this area as Coxville, a hydric soil. The site visit confirmed that the boundary of Wetlands "A", "B", and "C" directly intersects with the boundary of the perennial RPW. Wetland "E" directly abuts the downstream portion of the perennial RPW that has an obscured OHWM and channel due to the presence of downstream beaver dams.

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.**
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetlands in the review area: 0.25 a. (Wetland "D") + 0.26 a. (Wetland "G") + 1.72 a. (Wetland "H") + 9.09 a. (Wetland "I") = 11.32 acres.

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
   - Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide estimates for jurisdictional wetlands in the review area: acres.

7. **Impoundments of jurisdictional waters.**
   - As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
   - Demonstrate that impoundment was created from “waters of the U.S.,” or
   - Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
   - Demonstrate that water is isolated with a nexus to commerce (see E below).

   **Explain:**

   **E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):**
   - which are or could be used by interstate or foreign travelers for recreational or other purposes.
   - from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
   - which are or could be used for industrial purposes by industries in interstate commerce.
   - Interstate isolated waters. **Explain:**
   - Other factors. **Explain:**

   **Identify water body and summarize rationale supporting determination:**

   Provide estimates for jurisdictional waters in the review area (check all that apply):
   - Tributary waters: linear feet width (ft).
   - Other non-wetland waters: acres.
   - Identify type(s) of waters: .
   - Wetlands: acres.

---

9 To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.

10 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):
- If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
- Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
- Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
- Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain: .
- Other: (explain, if not covered above): .

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):
- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps.
- Corps navigable waters’ study.
- USGS NHD data.
- USGS 8 and 12 digit HUC maps.
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the perennial RPW #2 as a solid blue line.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the pRPW #2 and adjacent wetlands as Lumbee and Coxville, which are hydric soils.
- National wetlands inventory map(s). Cite name: The NWIs map the tributary and adjacent wetlands as palustrine wetlands (PFO1Fh, PFO1Ad, and PSS1Ad).
- State/Local wetland inventory map(s): .
- FEMA/FIRM maps: .
- 100-year Floodplain Elevation: (National Geodetic Vertical Datum of 1929)
- Photographs: Arial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the tributary and adjacent wetlands as forested.
- Other (Name & Date): Site photos provided by S&ME, Inc.
- Previous determination(s). File no. and date of response letter: SAC 2010-00600-4E; letter dated May 4, 2011.
- Applicable/supporting case law: .
- Applicable/supporting scientific literature: .
- Other information (please specify): .

B. ADDITIONAL COMMENTS TO SUPPORT JD: The tributary named perennial RPW #2 on the survey plat was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict a linear feature indicative of a tributary and the topographic map depicts this tributary as a solid blue line, which usually indicates perennial flow. This tributary is named Old Mill Creek. The site visit shows this tributary has indicators of perennial flow including a defined OHWM, a channel within bed and banks, a firm, sandy bottom of the channel, a lack of leaf litter and debris in the channel, and flowing water observed. This pRPW receives flow upstream (off site) from a large wetland system named "Betsy Johnson Bay" on the topo map and receives flow on site from abutting and non-abutting wetlands as
well as a non-jurisdictional ditch. Wetlands "A", "B", and "C" are portions of a larger wetland system that was
determined through review of the topo map, soil survey, and NWIs as well as a site visit to directly abut the perennial RPW.
Wetland "D" is separated from the perennial RPW by a man-made berm and Wetlands "G", "H", and "I" have a direct
hydrologic connection to the downstream perennial RPW via a non-jurisdictional ditch. These non-abutting wetlands were
found to have a significant nexus to the downstream TNW in Section III B&C above. The downstream portion of pRPW #2
has been impounded by beaver dams, located off site, and no OHWM or defined channel was observed upstream of the
beaver dams at the southern end of the site, labeled Wetland "E" on the plat. Downstream of the beaver dams, the
topographic map depicts this tributary as flowing directly into Reedy Creek, a pRPW, and then into Buck Swamp, pRPW,
prior to flowing in to the Little Pee Dee River (a TNW).
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: JD Form 4 of 7; SAC 2010-00600-4E I-95 Mega Site

C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   State: South Carolina   County/parish/borough: Dillon   City:
   Center coordinates of site (lat/long in degree decimal format): Lat. 34.406534° N, Long. -79.413387° W.
   Universal Transverse Mercator:
   Name of nearest waterbody: Old Mill Creek
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River
   Name of watershed or Hydrologic Unit Code (HUC): 03040204-04
   ☒ Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):
   ☐ Office (Desk) Determination. Date:
   ☒ Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION.
   There Are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
      Explain: .

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.
   There Are “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

   1. Waters of the U.S.
      a. Indicate presence of waters of U.S. in review area (check all that apply): 1
         ☐ TNWs, including territorial seas
         ☐ Wetlands adjacent to TNWs
         ☒ Relatively permanent waters2 (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

      b. Identify (estimate) size of waters of the U.S. in the review area:
         Non-wetland waters: 422 linear feet: 15-20width (ft) and/or 0.18 (pRPW #3) acres.
         Wetlands: acres.

      c. Limits (boundaries) of jurisdiction based on: Established by OHWM., Pick List, Pick List
         Elevation of established OHWM (if known):N/A.

   2. Non-regulated waters/wetlands (check if applicable):3
      ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.
      Explain: .

---

1 Boxes checked below shall be supported by completing the appropriate sections in Section III below.
2 For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).
3 Supporting documentation is presented in Section III.F.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: Little Pee Dee River.

   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed size: Pick List
   - Drainage area: Pick List
   - Average annual rainfall: inches
   - Average annual snowfall: inches

   (ii) Physical Characteristics:
   - Relationship with TNW:
     - [ ] Tributary flows directly into TNW.
     - [ ] Tributary flows through Pick List tributaries before entering TNW.
     - Project waters are Pick List river miles from TNW.
     - Project waters are Pick List river miles from RPW.
     - Project waters are Pick List aerial (straight) miles from TNW.
     - Project waters are Pick List aerial (straight) miles from RPW.
     - Project waters cross or serve as state boundaries. Explain: N/A.

   Identify flow route to TNW:

---

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

5 Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.
Tributary stream order, if known:  

(b) General Tributary Characteristics (check all that apply):

**Tributary** is:  
☐ Natural  
☐ Artificial (man-made). Explain:  
☐ Manipulated (man-altered). Explain:  

**Tributary** properties with respect to top of bank (estimate):

Average width:  feet  
Average depth:  feet  
Average side slopes: Pick List.

Primary tributary substrate composition (check all that apply):

☐ Silts  
☐ Sands  
☐ Gravel  
☐ Cobble  
☐ Bedrock  
☐ Vegetation. Type/% cover:  
☐ Other. Explain:  
☐ Concrete  
☐ Muck

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain:  
Presence of run/riffle/pool complexes. Explain:  
Tributary geometry: Pick List. Explain:  
Tributary gradient (approximate average slope):  

(c) Flow:

Tributary provides for: Pick List  
Estimate average number of flow events in review area/year: Pick List  
Describe flow regime:  
Other information on duration and volume:  
Surface flow is: Pick List. Characteristics:  
Subsurface flow: Pick List. Explain findings:  
☐ Dye (or other) test performed:  

Tributary has (check all that apply):

☐ Bed and banks  
☐ OHWM\(^6\) (check all indicators that apply):

☐ clear, natural line impressed on the bank  
☐ changes in the character of soil shelving  
☐ vegetation matted down, bent, or absent  
☐ leaf litter disturbed or washed away  
☐ sediment deposition  
☐ water staining  
☐ other (list):  
☐ the presence of litter and debris  
☐ destruction of terrestrial vegetation  
☐ the presence of wrack line  
☐ sediment sorting  
☐ scour  
☐ multiple observed or predicted flow events  
☐ abrupt change in plant community  
☐ Discontinuous OHWM.\(^7\) Explain:  

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):

☐ High Tide Line indicated by:  
☐ Mean High Water Mark indicated by:  
☐ oil or scum line along shore objects  
☐ fine shell or debris deposits (foreshore)  
☐ physical markings/characteristics  
☐ tidal gauges  
☐ other (list):  
☐ survey to available datum;  
☐ physical markings;  
☐ vegetation lines/changes in vegetation types.

(iii) Chemical Characteristics:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain:  
Identify specific pollutants, if known:  

---

\(^6\)A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.  

\(^7\)Ibid.
(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width): 
- Wetland fringe. Characteristics: 
- Habitat for:
  - Federally Listed species. Explain findings: 
  - Fish/spawn areas. Explain findings: 
  - Other environmentally-sensitive species. Explain findings: 
  - Aquatic/wildlife diversity. Explain findings: 

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
Properties:
- Wetland size: acres
- Wetland type. Explain: 
- Wetland quality. Explain: 
Project wetlands cross or serve as state boundaries. Explain: 

(b) General Flow Relationship with Non-TNW:
Flow is: Pick List. Explain: 
Surface flow is: Pick List. Characteristics: 
Subsurface flow: Pick List. Explain findings: 
Dye (or other) test performed: 

(c) Wetland Adjacency Determination with Non-TNW:
- Directly abutting
- Not directly abutting
  - Discrete wetland hydrologic connection. Explain: 
  - Ecological connection. Explain: 
  - Separated by berm/barrier. Explain: 

(d) Proximity (Relationship) to TNW:
Project wetlands are Pick List river miles from TNW. 
Project waters are Pick List aerial (straight) miles from TNW. 
Flow is from: Pick List. 
Estimate approximate location of wetland as within the Pick List floodplain. 

(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: 
Identify specific pollutants, if known: 

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian buffer. Characteristics (type, average width): 
- Vegetation type/percent cover. Explain: 
- Habitat for:
  - Federally Listed species. Explain findings: 
  - Fish/spawn areas. Explain findings: 
  - Other environmentally-sensitive species. Explain findings: 
  - Aquatic/wildlife diversity. Explain findings: 

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in the cumulative analysis: Pick List 
Approximately ( ) acres in total are being considered in the cumulative analysis.
For each wetland, specify the following:

<table>
<thead>
<tr>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Summarize overall biological, chemical and physical functions being performed: .

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D: .

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs: .

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), Or, acres.
   - Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs.
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The tributary named perennial RPW #3 on the survey plat was determined to have perennial flow
based on the aerials, topographic map, and site visit. The aerials depict this tributary as a linear feature and the topo map depicts this tributary as a solid blue line, which usually indicates it has perennial flow. The site visit shows this tributary has perennial flow based on the observance of a defined OHWM, water flowing in the channel, and a firm sandy bottom with a channel within bed and banks. No terrestrial vegetation, leaf litter or debris was observed in the channel. The downstream portion of this perennial RPW located on site (consisting of 422 linear feet) does not have any abutting wetlands and flows directly into another perennial RPW named pRPW #2 on the plat. pRPW #2 (named Old Mill Creek) flows into Reedy Creek (pRPW) and then into Buck Swamp (pRPW) before flowing into the Little Pee Dee River, a TNW.

Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: .

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: 422 linear feet 15-20 width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters: .

3. Non-RPWs\(^8\) that flow directly or indirectly into TNWs.
- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional waters within the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters: .

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands that directly abut RPW and thus are jurisdictional as adjacent wetlands.
- Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: .
- Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: .

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
- Wetlands adjacent to such waters, and when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters.\(^9\)
- As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
- Demonstrate that impoundment was created from “waters of the U.S.,” or
- Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain: The man-made Impoundment of WOUS (1.93 a.) was created by damming the Jurisdictional pRPW Tributary #1.

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):\(^10\)

---

\(^8\)See Footnote # 3.

\(^9\) To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain: .
- Other factors. Explain: .

Identify water body and summarize rationale supporting determination: .

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters: .
- Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):
- If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
- Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
- Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
- Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain: .
- Other: (explain, if not covered above): .

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply) - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):
- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps: .
- Corps navigable waters’ study: .
- USGS NHD data.
- USGS 8 and 12 digit HUC maps.
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the perennial RPW #3 as a solid blue line.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the pRPW #3 as Coxville, a hydric soil.
- National wetlands inventory map(s). Cite name: The NWIs map the tributary as palustrine wetlands (PSS1Ad).
- State/Local wetland inventory map(s): .
- FEMA/FIRM maps: .
- 100-year Floodplain Elevation is: (National Geodetic Vertical Datum of 1929)
- Photographs: Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the pRPW #3 as forested.

18 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
B. ADDITIONAL COMMENTS TO SUPPORT JD: The tributary named perennial RPW #3 on the survey plat was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict this tributary as a linear feature and the topo map depicts this tributary as a solid blue line, which usually indicates it has perennial flow. The site visit shows this tributary has perennial flow based on the observance of a defined OHWM, water flowing in the channel, and a firm sandy bottom with a channel within bed and banks. No terrestrial vegetation, leaf litter or debris was observed in the channel. The downstream portion of this perennial RPW located on site (consisting of 422 linear feet) does not have any abutting wetlands and flows directly into another perennial RPW named pRPW #2 on the plat. pRPW #2 (named Old Mill Creek) flows into Reedy Creek (pRPW) and then into Buck Swamp (pRPW) before flowing into the Little Pee Dee River, a TNW.
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016
B. PROJECT LOCATION AND BACKGROUND INFORMATION:
   State: South Carolina
   County/parish/borough: Dillon
   City: Center coordinates of site (lat/long in degree decimal format): Lat. 34°40'06.534" N, Long. 79°41'33.87" W.
   Name of nearest waterbody: Old Mill Creek
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River
   Name of watershed or Hydrologic Unit Code (HUC): 03040204-04
   Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.
   Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):
   Office (Desk) Determination. Date:
   Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION.
   There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]
   Waters subject to the ebb and flow of the tide.
   Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
   Explain: 

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.
   There are “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]
   1. Waters of the U.S.
      a. Indicate presence of waters of U.S. in review area (check all that apply): ¹
         - TNWs, including territorial seas
         - Wetlands adjacent to TNWs
         - Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs
         - Non-RPWs that flow directly or indirectly into TNWs
         - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         - Impoundments of jurisdictional waters
         - Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area:
         Non-wetland waters: 546 linear feet: 10-15 width (ft) and/or 0.06 (pRPW #4) acres.
         Wetlands: acres.
      c. Limits (boundaries) of jurisdiction based on: Established by OHWM., Pick List, Pick List
         Elevation of established OHWM (if known): N/A.
   2. Non-regulated waters/wetlands (check if applicable):³
      Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.
      Explain: The pRPW #4 receives water from several non-jurisdictional ditches. These non-jurisdictional ditches were observed during the site visit and determined to be man-made and excavated out of uplands. The upstream portion of pRPW #4 was also determined to be man-made and excavated out of uplands. However, pRPW #4 was determined

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.
² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).
³ Supporting documentation is presented in Section III.F.
during the site visit to be excavated out of wetlands. It is separated from Jurisdictional Wetland "C" by a berm created during the excavation of pRPW #4.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: Little Pee Dee River.

   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody4 is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed size: Pick List ;
      Drainage area: Pick List
      Average annual rainfall: inches
      Average annual snowfall: inches

   (ii) Physical Characteristics:
      (a) Relationship with TNW:
      ☐ Tributary flows directly into TNW.
      ☐ Tributary flows through Pick List tributaries before entering TNW.

      Project waters are Pick List river miles from TNW.
      Project waters are Pick List river miles from RPW.
      Project waters are Pick List aerial (straight) miles from TNW.
      Project waters are Pick List aerial (straight) miles from RPW.
      Project waters cross or serve as state boundaries. Explain: N/A.

      Identify flow route to TNW5: .

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

5 Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.
Tributary stream order, if known: .

(b) General Tributary Characteristics (check all that apply):

Tributary is: □ Natural  □ Artificial (man-made). Explain: .

Tributary properties with respect to top of bank (estimate):
Average width: feet
Average depth: feet
Average side slopes: Pick List.

Primary tributary substrate composition (check all that apply):
□ Silts  □ Sands  □ Concrete
□ Cobbles  □ Gravel  □ Muck
□ Bedrock  □ Vegetation. Type/% cover:
□ Other. Explain: .

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: .
Tributary geometry: Pick List. Explain: .
Tributary gradient (approximate average slope): %

(c) Flow:

Tributary provides for: Pick List
Estimate average number of flow events in review area/year: Pick List
Describe flow regime: .
Other information on duration and volume: .
Subsurface flow: Pick List. Explain findings: .
□ Dye (or other) test performed: .

Tributary has (check all that apply):
□ Bed and banks
□ OHWM* (check all indicators that apply):
□ clear, natural line impressed on the bank  □ the presence of litter and debris
□ changes in the character of soil  □ destruction of terrestrial vegetation
□ shelving  □ the presence of wrack line
□ vegetation matted down, bent, or absent  □ sediment sorting
□ leaf litter disturbed or washed away  □ scour
□ sediment deposition  □ multiple observed or predicted flow events
□ water staining  □ abrupt change in plant community
□ other (list): .
□ Discontinuous OHWM.† Explain: .

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):
□ High Tide Line indicated by: □ Mean High Water Mark indicated by:
□ oil or scum line along shore objects  □ survey to available datum;
□ fine shell or debris deposits (foreshore)  □ physical markings;
□ physical markings/characteristics  □ vegetation lines/changes in vegetation types.
□ tidal gauges  □ other (list):

(iii) Chemical Characteristics:
Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).
Explain: .
Identify specific pollutants, if known: .

---

*A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

†Ibid.
(iv) Biological Characteristics. Channel supports (check all that apply):
☐ Riparian corridor. Characteristics (type, average width): .
☐ Habitat for:
☐ Federally Listed species. Explain findings: .
☐ Fish/spawn areas. Explain findings: .
☐ Other environmentally-sensitive species. Explain findings: .
☐ Aquatic/wildlife diversity. Explain findings: .

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
Properties:
Wetland size: acres
Wetland type. Explain: .
Project wetlands cross or serve as state boundaries. Explain: .
(b) General Flow Relationship with Non-TNW:
Flow is: Pick List. Explain: .
Surface flow is: Pick List
Characteristics: .
Subsurface flow: Pick List. Explain findings: .
☐ Dye (or other) test performed: .
(c) Wetland Adjacency Determination with Non-TNW:
☐ Directly abutting
☐ Not directly abutting
☐ Discrete wetland hydrologic connection. Explain: .
☐ Ecological connection. Explain: .
☐ Separated by berm/barrier. Explain: .
(d) Proximity (Relationship) to TNW:
Project wetlands are Pick List river miles from TNW.
Project waters are Pick List aerial (straight) miles from TNW.
Flow is from: Pick List.
Estimate approximate location of wetland as within the Pick List floodplain.

(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: .
Identify specific pollutants, if known: .

(iii) Biological Characteristics. Wetland supports (check all that apply):
☐ Riparian buffer. Characteristics (type, average width): .
☐ Vegetation type/percent cover. Explain: .
☐ Habitat for:
☐ Federally Listed species. Explain findings: .
☐ Fish/spawn areas. Explain findings: .
☐ Other environmentally-sensitive species. Explain findings: .
☐ Aquatic/wildlife diversity. Explain findings: .

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in the cumulative analysis: Pick List
Approximately ( ) acres in total are being considered in the cumulative analysis.
C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D: .

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs: .

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), Or, acres.
   - Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs.
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The tributary named perennial RPW #4 on the survey plat was determined to have perennial flow
based on the aerials, topographic map, and site visit. The aerials depict this tributary as a linear feature. The site visit shows this tributary has perennial flow based on the observance of a defined OHWM, water flowing in the channel, and a firm sandy bottom with a channel within bed and banks. No terrestrial vegetation, leaf litter or debris was observed in the channel. PRPW #4 was excavated out of the eastern portion of Wetland "C" on site and flows directly into another perennial RPW named pRPW #2 on the plat. pRPW #2 (named Old Mill Creek) flows into Reedy Creek (pRPW) and then into Buck Swamp (pRPW) before flowing into the Little Pee Dee River, a TNW.

- Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: 546 linear feet 10-15 width (ft).
- Other non-wetland waters: acres. Identify type(s) of waters:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional waters within the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres. Identify type(s) of waters:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
- Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

- Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

- Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters.⁹

As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
- Demonstrate that impoundment was created from “waters of the U.S.,” or
- Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain:

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):¹⁰

---

⁹See Footnote # 3.

¹⁰To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.

¹⁰Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain: .
- Other factors. Explain: .

Identify water body and summarize rationale supporting determination: .

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters: .
- Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):
- If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
- Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
- Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
- Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain: .
- Other: (explain, if not covered above): .

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):
- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply) - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):
- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps: .
- Corps navigable waters’ study: .
- USGS NHD data.
- USGS 8 and 12 digit HUC maps.
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the perennial RPW #4 as a solid blue line.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the pRPW #4 as Coxville, a hydric soil.
- National wetlands inventory map(s). Cite name: The NWIs map the tributary as palustrine wetlands (PFO1Ad).
- State/Local wetland inventory map(s): .
- FEMA/FIRM maps: .
- 100-year Floodplain Elevation is: (National Geodectic Vertical Datum of 1929)
- Photographs: Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the pRPW #4 as a shaded linear feature.
B. ADDITIONAL COMMENTS TO SUPPORT JD: The pRPW #4 receives water from several non-jurisdictional ditches. These non-jurisdictional ditches were observed during the site visit and determined to be man-made and excavated out of uplands. The upstream portion of pRPW #4 was also determined to be man-made and excavated out of uplands. However, pRPW #4 was determined during the site visit to be excavated out of wetlands. It is separated from Jurisdictional Wetland "C" by a berm created during the excavation of pRPW #4. The tributary named perennial RPW #4 on the survey plat was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict this tributary as a linear feature. The site visit shows this tributary has perennial flow based on the observance of a defined OHWM, water flowing in the channel, and a firm sandy bottom with a channel within bed and banks. No terrestrial vegetation, leaf litter or debris was observed in the channel. PRPW #4 flows directly into another perennial RPW named pRPW #2 on the plat. pRPW #2 (named Old Mill Creek) flows into Reedy Creek (pRPW) and then into Buck Swamp (pRPW) before flowing into the Little Pee Dee River, a TNW.
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): May 11, 2016

B. PROJECT LOCATION AND BACKGROUND INFORMATION:

State: South Carolina
County/parish/borough: Dillon
City:
Center coordinates of site (lat/long in degree decimal format): Lat. \(34.406534^\circ\) N, Long. \(-79.413387^\circ\) W.

Universal Transverse Mercator:

Name of nearest waterbody: Unnamed tributary of Old Mill Creek
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River
Name of watershed or Hydrologic Unit Code (HUC): 03040204-04

☑ Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): February 3, 2016

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain: .

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There are “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.

a. Indicate presence of waters of U.S. in review area (check all that apply): ¹

☐ TNWs, including territorial seas
☐ Wetlands adjacent to TNWs
☒ Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area:

Non-wetland waters: \(818\) linear feet: \(10\) width (ft) and/or \(0.04\) (sRPW #6) + \(0.13\) a. (sRPW #6A) = \(0.17\) acres.

Wetlands: \(9.56\) a. (Jurisdictional Wetland "J") + \(0.15\) a. (Jurisdictional Wetland "K") + \(185.90\) (Jurisdictional Wetland "L") = \(195.61\) acres.

2. Non-regulated waters/wetlands (check if applicable):³

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.
Explain: The upstream portion of sRPW #6 was assessed during the site visit and determined to be a non-jurisdictional ditch with less than seasonal flow. Although the topographic map depicts sRPW #6 continuing southeast into Wetland

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.
² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).
³ Supporting documentation is presented in Section III.F.
"L" on the site, no channel was observed within Wetland "L". The upstream portion of sRPW #6 is actually located northeast of sRPW #6 and consists of two non-jurisdictional ditches located within agricultural fields that intersect and travel southwest where they intersect with the boundary of Wetland "J". Once this non-jurisdictional ditch intersects with the boundary of Wetland "J", the tributary becomes a seasonal RPW based on the determination described in Section III D2.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: Little Pee Dee River.
   
   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody 4 is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed size: 97,495 acres; HUC 03040204-04 - Buck Swamp
      Drainage area: 966 acres
      Average annual rainfall: 47.05 inches
      Average annual snowfall: 1.7 inches

   (ii) Physical Characteristics:
      (a) Relationship with TNW:
         □ Tributary flows directly into TNW.
         ☒ Tributary flows through 3 tributaries before entering TNW.

         Project waters are 20-25 river miles from TNW.
         Project waters are 1 (or less) river miles from RPW.
         Project waters are 15-20 aerial (straight) miles from TNW.
         Project waters are 1 (or less) aerial (straight) miles from RPW.
         Project waters cross or serve as state boundaries. Explain: N/A.

---

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.
Identify flow route to TNW: The unnamed tributary depicted on the plat as sRPW #6 and sRPW #6A flows directly into the tributary depicted as pRPW #2 on the plat and named Old Mill Creek. PRPW #2 flows directly into Reedy Creek, a PRPW. Reedy Creek flows into Buck Swamp, a PRPW, before flowing into the Little Pee Dee River, a TNW.

Tributary stream order, if known: The pRPW #6 & #6A is a 1st order stream.

(b) General Tributary Characteristics (check all that apply):

- Natural
- Artificial (man-made). Explain:
- Manipulated (man-altered). Explain: The upstream portion of the seasonal RPW was excavated out of wetlands and comprises the property boundary of the project site.

Tributary properties with respect to top of bank (estimate):
- Average width: 10 feet
- Average depth: 3-5 feet
- Average side slopes: Vertical (1:1 or less).

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Cobbles
- Gravel
- Bedrock
- Vegetation. Type/% cover:
- Other. Explain: 

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: The tributary is relatively stable with no erosion or sloughing banks observed.

Presence of run/riffle/pool complexes. Explain: No run/riffle/pool complexes were observed.

Tributary geometry: Relatively straight.

Tributary gradient (approximate average slope): %

(c) Flow:

Tributary provides for: Seasonal flow

Estimate average number of flow events in review area/year: 11-20

Describe flow regime: This tributary receives flow from the upstream, on-site, and downstream wetlands via overland sheetflow and from the non-jurisdictional ditches that receive water from adjacent uplands.

Other information on duration and volume: Flow is during the wetter months.

Surface flow is: Discrete and confined. Characteristics: 

Subsurface flow: Unknown. Explain findings: 

Dye (or other) test performed: 

Tributary has (check all that apply):
- Bed and banks
- OHWM\(^6\) (check all indicators that apply):
  - clear, natural line impressed on the bank
  - changes in the character of soil
  - shelving
  - vegetation matted down, bent, or absent
  - leaf litter disturbed or washed away
  - sediment deposition
  - water staining
  - other (list): the presence of litter and debris
  - destruction of terrestrial vegetation
  - the presence of wrack line
  - sediment sorting
  - scour
  - multiple observed or predicted flow events
  - abrupt change in plant community

Discontinuous OHWM.\(^7\) Explain: 

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):
- High Tide Line indicated by: 
  - oil or scum line along shore objects
  - fine shell or debris deposits (foreshore)
  - physical markings/characteristics
  - tidal gauges
  - other (list):

Mean High Water Mark indicated by:
- survey to available datum:
- physical markings:
- vegetation lines/changes in vegetation types.

---

\(^5\) Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

\(^6\)A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

\(^7\)Ibid.
Chemical Characteristics:
Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).

Explain: The channel bottom of the tributary consisted of a layer of muck and silts over sands, and no terrestrial vegetation was observed within the channel. A defined OHWM was observed; however, no water was present in the channel. This watershed is approximately 43% agricultural land and 25% forested wetland. Additional land uses consist of forested land, urban land, scrub/shrub land, non-forest wetland, and water.

Identify specific pollutants, if known: According to SCDHEC, a review of the downstream monitoring station for Buck Swamp (PD-031) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width):
- Wetland fringe. Characteristics: The seasonal RPW directly abuts Wetlands "L", "J", "K", and "E" (which are on-site portions of a larger wetland system). Wetland "E" on site, which also abuts PRPW #2, is described on JD Form 3 of 7.
- Habitat for:
  - Federally Listed species. Explain findings:
  - Fish/spawn areas. Explain findings:
  - Other environmentally-sensitive species. Explain findings:
  - Aquatic/wildlife diversity. Explain findings: This seasonal RPW provides an important habitat and corridor for wildlife as well as a connection to the downstream TNW for aquatic species.

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
Properties:
Wetland size: 9.56 a. (Jurisdictional Wetland "J") + 0.15 a. (Jurisdictional Wetland "K") + 185.90 a. (Jurisdictional Wetland "L") = 195.61 acres
Wetland type. Explain: Palustrine forested
Wetland quality. Explain: Although portions of the wetlands on site have been clear-cut in the past, the majority of the wetland system was determined to be fully functional.

Project wetlands cross or serve as state boundaries. Explain: This wetland system, which consists of wetlands within the 966 acre drainage area, is located on and immediately south of the project boundaries and does not cross or serve as state boundaries.

(b) General Flow Relationship with Non-TNW:
Flow is: Intermittent flow. Explain: The seasonal RPW flows within the wetland system.

Surface flow is: Overland sheetflow
Characteristics:
Subsurface flow: Unknown. Explain findings:
- Dye (or other) test performed:

(c) Wetland Adjacency Determination with Non-TNW:
- Directly abutting
- Not directly abutting
  - Discrete wetland hydrologic connection. Explain:
  - Ecological connection. Explain:
  - Separated by berm/barrier. Explain:

(d) Proximity (Relationship) to TNW
Project wetlands are 20-25 river miles from TNW.
Project waters are 15-20 aerial (straight) miles from TNW.
Flow is from: Wetland to navigable waters.
Estimate approximate location of wetland as within the 100 - 500-year floodplain.

(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics, etc.). Explain: Although a portion of the wetland system (Wetland "J") has been clear-cut, the majority of the wetlands are fully functional. These wetlands are seasonally saturated or inundated. This watershed is approximately 43% agricultural land and 25% forested wetland. Additional land uses consist of forested land, urban land, scrub/shrub land, non-forest wetland, and water.

Identify specific pollutants, if known: According to SCDHEC, a review of the downstream monitoring station for Buck Swamp (PD-031) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to...
fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

(iii) Biological Characteristics. Wetland supports (check all that apply):

- ☒ Vegetation type/percent cover. Explain: Liquidambar styraciflua (FAC), Acer rubrum (FAC), Persea borbonia (FACW), Pinus taeda (FAC), Quercus phellos (FACW), and Quercus nigra (FAC).
- ☐ Federal Listed species. Explain findings:
- ☐ Fish/spawn areas. Explain findings:
- ☐ Other environmentally-sensitive species. Explain findings:
- ☐ Aquatic/wildlife diversity. Explain findings:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: 4

Approximately (365) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

<table>
<thead>
<tr>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>0.15</td>
<td>Y</td>
<td>9.61</td>
</tr>
<tr>
<td>Y</td>
<td>170</td>
<td>Y</td>
<td>185.90</td>
</tr>
</tbody>
</table>

Summarize overall biological, chemical and physical functions being performed: The sRPW and Wetlands "J", "K", and "L" in the review area contribute vital biological, chemical, and physical functions to the downstream TNW. The three wetlands on site are a portion of a larger wetland system that flows west and flows directly into Old Mill Creek, a perennial RPW. This wetland system and the adjacent sRPW make up an important ecological system with vital aquatic habitat that supports an abundance of wildlife in a watershed that consists predominately of agricultural fields. This area is also located adjacent to US Interstate 95 and southwest of the City of Dillon, which is an area that has a moderate rate of growth and the majority of the industrial land in this county. Due to the prevalence of agriculture land use in this watershed and the nearby development outside of the city limits, this wetland is acting as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amount of flood waters reaching the downstream TNW.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:
1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D: .

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: .

Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs: The sRPW and adjacent wetlands in the review area contribute vital biological, chemical, and physical functions to the downstream TNW. The three wetlands all provide important aquatic habitat used for feeding, nesting, and other functions that support wildlife within uplands that are predominately in use as ag. fields. Due to the prevalence of agriculture land use in this watershed and the potential for industrial development on this site, this seasonal RPW and the adjacent wetlands act as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amount of flood waters reaching the downstream TNW. Due to the industrial land use and potential for development on this site, these waters of the US are a vital part of the 966 drainage area and were determined to have a significant nexus to the downstream TNW.

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: linear feet width (ft), Or, acres.
   - Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs.
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: .

   Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: Based on a site visit and a review of aerials, topographic map, NWIs and soil surveys, the tributary that comprises the southern property boundary of the site flows at least three months per year. This tributary has an OWHM with a channel consisting of a layer of muck over a firm, sandy bottom. The channel contained no leaf litter, debris, or vegetation. Wrack lines were observed in the channel and exposed roots were observed in the stream banks. The topographic map shows this tributary as a solid blue line, which usually indicates perennial flow, originating within Wetland “L” near the southeastern property boundary. However, the site visit and aerials determine that the sRPW originates at the intersection with Wetland “J” on site. Man-made, non-jurisdictional ditches located upstream of the sRPW that flow into the sRPW are located northeast of the tributary and no tributaries were observed within Wetland “L”. This tributary receives overland sheetflow from the surrounding wetlands on and off site as well as discrete and confined flow from the upstream non-jurisdictional ditches. This tributary flows southeast before intersecting with Wetland “E” on the property where the defined channel is obscured due to the influence of several downstream beaver dams. The flow from this sRPW (labeled sRPW #6 on the plat) travels into the perennial RPW named Old Mill Creek. Old Mill Creek flows into Reedy Creek (a pRPW) and then into Buck Swamp (pRPW) prior to flowing into the Little Pee Dee River, a TNW.

   Provide estimates for jurisdictional waters in the review area (check all that apply):
   - Tributary waters: **818** linear feet **10** width (ft).
   - Other non-wetland waters: acres.
   - Identify type(s) of waters: .

3. Non-RPWs<sup>8</sup> that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide estimates for jurisdictional waters within the review area (check all that apply):
   - Tributary waters: linear feet width (ft).
   - Other non-wetland waters: acres.
   - Identify type(s) of waters: .

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

<sup>8</sup>See Footnote # 3.
Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: 

- Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

Based on a review of aerials, topographic maps, soil surveys, and NWIs, as well as a site visit, the wetlands labeled Wetlands "L", "I", "J", "K", and "E" are all a portion of a larger wetland system that directly abuts the seasonal RPW labeled sRPW #6 & #6A on the plat. The topographic map depicts a solid blue line that intersects Wetlands "L", "I", "J", "K", and "E" and the aerials depict a wetland system, a portion of which is on the project site, that intersects with the boundary of the linear feature. Wetland "E" was determined to be jurisdictional based on its adjacency to pRPW #2 on JD Form 3 of 7. The NWIs map these wetlands as palustrine forested and depict the wetlands as a continuous wetland system that travels northeast toward Old Mill Creek. The soil survey maps this entire area as Coxville, a hydric soil.

Provide acreage estimates for jurisdictional wetlands in the review area: 9.56 a. (Jurisdictional Wetland "J") + 0.15 a. (Jurisdictional Wetland "K") + 185.90 (Jurisdictional Wetland "L") = 195.61 acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
- Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
- Demonstrate that impoundment was created from “waters of the U.S.” or
- Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain:

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):18
- which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain: 
- Other factors. Explain: 

Identify water body and summarize rationale supporting determination: 

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: linear feet width (ft).
- Other non-wetland waters: acres.
- Identify type(s) of waters: 
- Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):
- If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
- Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.

---

9 To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
18 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).

Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain: .

Other: (explain, if not covered above): .

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource: .
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant:
  - Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps: .
- Corps navigable waters’ study: .
- USGS navigable water data: .
- USGS 8 and 12 digit HUC maps: .
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the seasonal RPW #6 as a solid blue line.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the sRPW #6 & #6A and adjacent wetlands as Coxville, which is a hydric soil.
- National wetlands inventory map(s). Cite name: The NWIs map the tributary and adjacent wetlands as palustrine wetlands (PFO4Ad, PFO1/SS1Ad).
- State/Local wetland inventory map(s): .
- FEMA/FIRM maps: .
- 100-year Floodplain Elevation is: (National Geodetic Vertical Datum of 1929)
- Photographs: Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the tributary and adjacent wetlands as forested.
- or Other (Name & Date): Site photos provided by S&ME, Inc.
- Previous determination(s). File no. and date of response letter: SAC 2010-00600-4E; letter dated May 4, 2011.
- Applicable/supporting case law: .
- Applicable/supporting scientific literature: .
- Other information (please specify): .

B. ADDITIONAL COMMENTS TO SUPPORT JD: Based on a review of aerials, topographic maps, soil surveys, and NWIs, as well as a site visit, the wetlands labeled Wetlands "L", "J", and "K" are all a portion of a larger wetland system that directly abuts the seasonal RPW labeled sRPW #6 & #6A on the plat. The topographic map depicts a solid blue line that intersects Wetlands "L", "J", "K", and "E" and the aerials depict a wetland system, a portion of which is on the project site, that intersects with the boundary of the linear feature. Wetland "E" was determined to be jurisdictional based on its adjacency to pRPW #2 on JD Form 3 of 7. The NWIs map these wetlands as palustrine forested and depict the wetlands as a continuous wetland system that travels northeast toward Old Mill Creek. The soil survey maps this entire area as Coxville, a hydric soil.

Based on a site visit and a review of aerials, topographic map, NWIs and soil surveys, the tributary that comprises the southern property boundary of the site flows at least three months per year. This tributary has an OWHM with a channel consisting of a layer of muck over a firm, sandy bottom. The channel contained no leaf litter, debris, or vegetation. Wrack lines were observed in the channel and exposed roots were observed in the stream banks. The topographic map shows this tributary as a solid blue line, which usually indicates perennial flow, originating within Wetland "L" near the southeastern property boundary.
However, the site visit and aerials determine that the sRPW originates at the intersection with Wetland "J" on site. Man-made, non-jurisdictional ditches located upstream of the sRPW that flow into the sRPW are located northeast of the tributary and no tributaries were observed within Wetland "I." This tributary receives overland sheetflow from the surrounding wetlands on and off site as well as discrete and confined flow from the upstream non-jurisdictional ditches. This tributary flows southeast before intersecting with Wetland "E" on the property where the defined channel is obscured due to the influence of several downstream beaver dams. The flow from this sRPW (labeled sRPW #6 on the plat) travels into the perennial RPW named Old Mill Creek. Old Mill Creek flows into Reedy Creek (a pRPW) and then into Buck Swamp (pRPW) prior to flowing into the Little Pee Dee River, a TNW.
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

**SECTION I: BACKGROUND INFORMATION**

A. **REPORT COMPLETION DATE FOR APPROVED JURISD ICTIONAL DETERMINATION (JD):** May 11, 2016

B. **DISTRICT OFFICE, FILE NAME, AND NUMBER:** JD Form 7 of 7; SAC 2010-00600-4E I-95 Mega Site

C. **PROJECT LOCATION AND BACKGROUND INFORMATION:**
   - State: South Carolina
   - County/parish/borough: Dillon
   - City: Center coordinates of site (lat/long in degree decimal format): Lat. 34.406534° N, Long. -79.413387° W.
   - Name of nearest waterbody: *Unnamed tributary of Maple Swamp*
   - Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Little Pee Dee River
   - Name of watershed or Hydrologic Unit Code (HUC): 03040204-04
   - Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.
   - Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. **REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):**
   - Office (Desk) Determination. Date:
   - Field Determination. Date(s): February 3, 2016

**SECTION II: SUMMARY OF FINDINGS**

A. **RHA SECTION 10 DETERMINATION OF JURISDICTION.**

There **are no** “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]

   - Waters subject to the ebb and flow of the tide.
   - Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
     - Explain: .

B. **CWA SECTION 404 DETERMINATION OF JURISDICTION.**

There **are** “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. **Waters of the U.S.**
   - a. **Indicate presence of waters of U.S. in review area (check all that apply):**
     - TNWs, including territorial seas
     - Wetlands adjacent to TNWs
     - Relatively permanent waters\(^2\) (RPWs) that flow directly or indirectly into TNWs
     - Non-RPWs that flow directly or indirectly into TNWs
     - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
     - Impoundments of jurisdictional waters
     - Isolated (interstate or intrastate) waters, including isolated wetlands

   b. **Identify (estimate) size of waters of the U.S. in the review area:**
     - Non-wetland waters: linear feet: width (ft) and/or acres.
     - Wetlands: *(Jurisdictional Wetland "R")* 5.95 acres.

   c. **Limits (boundaries) of jurisdiction** based on: 1987 Delineation Manual, Pick List, Pick List
     - Elevation of established OHWM (if known): N/A.

2. **Non-regulated waters/wetlands (check if applicable):**\(^3\)
   - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional.
     - **Explain:** Several potentially jurisdictional tributaries were assessed in the review area and determined to be non-jurisdictional ditches with less than seasonal flow. These non-jurisdictional ditches are located within the drainage area of the off-site perennial RPW, an unnamed tributary of Maple Swamp, in the drainage area and were all

---

\(^1\) Boxes checked below shall be supported by completing the appropriate sections in Section III below.

\(^2\) For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least “seasonally” (e.g., typically 3 months).

\(^3\) Supporting documentation is presented in Section III.F.
determined to be non-jurisdictional during the site visit. The ditches are depicted on the topographic map as a solid blue line and are depicted on the aerial as linear features. However, they are all excavated out of uplands and were excavated to drain the surrounding agricultural fields on site. Only one of the non-jurisdictional ditches in the drainage area (the upstream portion of the perennial RPW) connects a wetland to the downstream seasonal RPW. All of these non-jurisdictional ditches were observed during the site visit to have waterstained leaf litter and debris in the channel and a thick layer of muck over a firm sandy bottom. Terrestrial vegetation was present in portions of these ditches. The ditch located upstream of the off-site perennial RPW was observed to have water in the channel with waterstained leaf litter and debris which showed that this portion of the ditch was holding and/or intercepting groundwater; however, no water was observed flowing out of this area and downstream the ditch had dry leaf litter and debris in the channel and no water was present. The off-site perennial RPW is described in Section III D2.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: Little Pee Dee River.

   Summarize rationale supporting determination: According to the USACE Navigability Study Report No. 12, the Little Pee Dee River’s recommended limit of navigability is located approximately at River Mile (RM) 98. The project waters enter the Little Pee Dee River at approximately RM 84.

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed size: 132,753 acres; HUC 03040204-05
      Drainage area: 328 acres
      Average annual rainfall: 47.05 inches
      Average annual snowfall: 1.7 inches

   (ii) Physical Characteristics:

      (a) Relationship with TNW:

         ☑ Tributary flows directly into TNW.
         ☑ Tributary flows through 1 tributaries before entering TNW.

         Project waters are 2-5 river miles from TNW.
         Project waters are 1 (or less) river miles from RPW.
         Project waters are 2-5 aerial (straight) miles from TNW.
         Project waters are 1 (or less) aerial (straight) miles from RPW.
         Project waters cross or serve as state boundaries. Explain: N/A.

---

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.
Identify flow route to TNW:\(^5\): The sRPW\(^8\) (as depicted on the plat) flows into a perennial RPW named Maple Swamp. Maple Swamp flows directly into the Little Pee Dee River (TNW).

Tributary stream order, if known: The pRPW is a 1\(^{st}\) order stream that originates immediately east of the site.

(b) General Tributary Characteristics (check all that apply):

**Tributary is:**
- [ ] Natural
- [ ] Artificial (man-made). Explain: 
- [ ] Manipulated (man-altered). Explain: 

**Tributary properties with respect to top of bank (estimate):**
- Average width: 6 feet
- Average depth: 4-6 feet
- Average side slopes: **Vertical (1:1 or less).**

Primary tributary substrate composition (check all that apply):
- [x] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Cobble
- [ ] Gravel
- [ ] Muck
- [ ] Bedrock
- [ ] Vegetation. Type/% cover: 
- [ ] Other. Explain: 

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: The tributary is relatively stable with no erosion or sloughing banks observed.

Presence of run/riffle/pool complexes. Explain: **No run/riffle/pool complexes were observed.**

Tributary geometry: **Meandering.**

Tributary gradient (approximate average slope): 

(c) Flow:

**Tributary provides for:** **Perennial flow**

Estimate average number of flow events in review area/year: **20 (or greater)**

Describe flow regime: **This tributary receives flow from the upstream wetland via a non-jurisdictional ditch and from the other non-jurisdictional ditches that receive water from adjacent uplands.**

Other information on duration and volume: 

Surface flow is: **Discrete and confined.** Characteristics: 

Subsurface flow: **Unknown.** Explain findings: 
- [ ] Dye (or other) test performed: 

Tributary has (check all that apply):
- [x] Bed and banks
- [x] OHWM\(^6\) (check all indicators that apply):
  - clear, natural line impressed on the bank
  - changes in the character of soil
  - shelving
  - vegetation matted down, bent, or absent
  - leaf litter disturbed or washed away
  - sediment deposition
  - water staining
  - other (list): 
- **Discontinuous OHWM.**\(^7\) Explain: 

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):
- [ ] High Tide Line indicated by: 
  - oil or scum line along shore objects
  - fine shell or debris deposits (foreshore)
  - physical markings/characteristics
  - tidal gauges
  - other (list): 
- Mean High Water Mark indicated by: 
  - survey to available datum;
  - physical markings;
  - vegetation lines/changes in vegetation types.

(iii) Chemical Characteristics:

---

\(^5\) Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

\(^6\) A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

\(^7\) Ibid.
Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.).

Explain: The channel bottom of the tributary consisted of a layer of silts approximately 6” deep over a sandy bottom, and no terrestrial vegetation, leaf litter, or debris was observed within the channel. A defined OHWM was observed and water was observed flowing during the site visit. This watershed is approximately 46% agricultural land and 28% forested wetland. Additional land uses consist of forested land, urban land, scrub/shrub land, non-forested wetland, and water.

Identify specific pollutants, if known: According to SCDHEC, a review of the downstream monitoring station for Maple Swamp (PD-030) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor. Characteristics (type, average width): Forested, 10-50' wide.
- Wetland fringe. Characteristics:
- Habitat for:
  - Federally Listed species. Explain findings:
  - Fish/spawn areas. Explain findings:
  - Other environmentally-sensitive species. Explain findings:
  - Aquatic/wildlife diversity. Explain findings: This perennial RPW provides an important habitat and corridor for wildlife as well as a connection to the downstream TNW for aquatic species.

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics:
Properties:
- Wetland size: 5.95 (Wetland "R") acres
- Wetland type. Explain: Palustrine forested.
- Wetland quality. Explain: This wetland is considered slightly impaired due to clearcutting across the entire wetland.

Project wetlands cross or serve as state boundaries. Explain: N/A.

(b) General Flow Relationship with Non-TNW:
Flow is: Intermittent flow. Explain:
Surface flow is: Discrete and confined
Characteristics: The wetland is connected to the downstream pRPW via a non-jurisdictional ditch.
Subsurface flow: Unknown. Explain findings:
- Dye (or other) test performed:

(c) Wetland Adjacency Determination with Non-TNW:
- Directly abutting
- Not directly abutting
  - Discrete wetland hydrologic connection. Explain: Jurisdictional Wetland "R" has a direct hydrological connection to the downstream perennial RPW (unnamed tributary of Maple Swamp) via a non-jurisdictional ditch.
- Ecological connection. Explain:
- Separated by berm/barrier. Explain:

(d) Proximity (Relationship) to TNW
Project wetlands are 5-10 river miles from TNW.
Project waters are 2-5 aerial (straight) miles from TNW.
Flow is from: Wetland to navigable waters.
Estimate approximate location of wetland as within the 100 - 500-year floodplain.

(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: Wetland "R" is located within an area on site that has been clear-cut in the past and is considered slightly impaired. This wetland is seasonally saturated or inundated. This watershed is approximately 46% agricultural land and 28% forested wetland. Additional land uses consist of forested land, urban land, scrub/shrub land, non-forested wetland, and water.

Identify specific pollutants, if known: According to SCDHEC, a review of the downstream monitoring station for Maple Swamp (PD-030) shows this area fully supports aquatic life uses. Recreational uses are partially supported at this site due to fecal coliform excursions. Although dissolved oxygen excursions occur at this site, they are typical of values seen in blackwater systems and are considered natural instead of a violation.

(iii) Biological Characteristics. Wetland supports (check all that apply):
Riparian buffer. Characteristics (type, average width): .
Vegetation type/percent cover. Explain: Liquidambar styraciflua (FAC), Pinus taeda (FAC), Quercus phellos (FACW), and Quercus nigra (FAC).
Habitat for:
Federaely Listed species. Explain findings: .
Fish/spawn areas. Explain findings: .
Other environmentally-sensitive species. Explain findings: .
Aquatic/wildlife diversity. Explain findings: This wetland provides an important habitat for aquatic species and other wildlife.

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in the cumulative analysis: 1
Approximately (6) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

<table>
<thead>
<tr>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
<th>Directly abuts? (Y/N)</th>
<th>Size (in acres)</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>5.95</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Summarize overall biological, chemical and physical functions being performed: The pRPW and its adjacent wetland (labeled Wetland "R" on the plat) contribute vital biological, chemical, and physical functions to the downstream TNW. Wetland "R" and the downstream pRPW make up an important ecological system with vital aquatic habitat that supports an abundance of wildlife in a watershed that consists predominately of agricultural fields. This area is also located adjacent to US Interstate 95 and southwest of the City of Dillon, which is an area that has a moderate rate of growth and the majority of the industrial land in this county. Due to the prevalence of agriculture land use in this watershed and the nearby development outside of the city limits, this wetland and pRPW are acting as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amount of flood waters reaching the downstream TNW.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: 

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: 

   The perennial RPW, which is an unnamed tributary of Maple Swamp, and the nonabutting wetland labeled Wetland "R" contribute vital biological, chemical, and physical functions to the downstream TNW. The wetland provides important aquatic habitat used for feeding, nesting, and other functions that support wildlife within uplands that are predominately in use as ag. fields. This wetland also acts as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amounts of flood waters that can reach the downstream TNW. Wetland "R" is separated from the perennial RPW by uplands and has a direct hydrological connection to the downstream PRPW via a non-jurisdictional ditch. Because of this connection, this wetland has the capacity to transfer nutrients to the downstream pRPW that provide support to the aquatic wildlife in the perennial RPW and the downstream TNW. Due to the prevalence of agriculture land use in this watershed and the potential for industrial development on this site, this wetland is a vital part of the perennial RPW's 328 acre drainage area and was determined to have a significant nexus to the downstream TNW.

   Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs:

   D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

   1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
      - TNWs: linear feet width (ft), Or, acres.
      - Wetlands adjacent to TNWs: acres.

   2. RPWs that flow directly or indirectly into TNWs. 
      - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The off-site tributary was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict a linear feature indicative of a tributary and the topographic map depicts this tributary as a solid blue line, which usually indicates perennial flow. This tributary is an unnamed tributary of Maple Swamp. The site visit shows this tributary has indicators of perennial flow including a defined OHWM, a channel within bed and banks, a lack of leaf litter and debris in the channel, and flowing water observed. This pRPW receives flow upstream from a non-abutting wetland as well as a several non-jurisdictional ditches. This tributary flows into Maple Swamp, a pRPW, prior to flowing in to the Little Pee Dee River (a TNW).

      - Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

      Provide estimates for jurisdictional waters in the review area (check all that apply):
      - Tributary waters: 3504 linear feet 15-20 width (ft).
      - Other non-wetland waters: acres.
      - Identify type(s) of waters:

   3. Non-RPWs8 that flow directly or indirectly into TNWs.
      - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

      Provide estimates for jurisdictional waters within the review area (check all that apply):
      - Tributary waters: linear feet width (ft).
      - Other non-wetland waters: acres.
      - Identify type(s) of waters:

   4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
      - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
      - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

\[8\text{See Footnote # 3.}\]
Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

Provide acreage estimates for jurisdictional wetlands in the review area: acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. 

Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: 5.95 (Wetland "R") acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.

Demonstrate that impoundment was created from “waters of the U.S.,” or
Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
Demonstrate that water is isolated with a nexus to commerce (see E below).

Explain:

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):¹⁰

Identify water body and summarize rationale supporting determination:

Provide estimates for jurisdictional waters in the review area (check all that apply):

Tributary waters: linear feet width (ft).
Other non-wetland waters: acres.
Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):

If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.

Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain:

Other: (explain, if not covered above): Several non-jurisdictional ditches were assessed within the review area.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
Lakes/ponds: acres.
Other non-wetland waters: acres. List type of aquatic resource:
Wetlands: acres.

¹⁰ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters (i.e., rivers, streams): linear feet, width (ft).
- Lakes/ponds: acres.
- Other non-wetland waters: acres. List type of aquatic resource:.
- Wetlands: acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Inc; plat by Survey One, LLC.
- Data sheets prepared/submitted by or on behalf of the applicant/consultant.
- Office concurs with data sheets/delineation report.
- Office does not concur with data sheets/delineation report.
- Data sheets prepared by the Corps:.
- Corps navigable waters’ study:.
- U.S. Geological Survey Hydrologic Atlas:.
- USGS NHD data.
- USGS 8 and 12 digit HUC maps.
- U.S. Geological Survey map(s). Cite scale & quad name: Dillon West; The topographic map depicts the perennial RPW #2 as a solid blue line.
- USDA Natural Resources Conservation Service Soil Survey. Citation: Page 16; The soil survey maps the wetland as Coxville, a hydric soil.
- National wetlands inventory map(s). Cite name: The NWIs map Wetland "R" as palustrine forested (PFO4Ad).
- State/Local wetland inventory map(s):.
- FEMA/FIRM maps:.
- 100-year Floodplain Elevation is: (National Geodectic Vertical Datum of 1929)
- Photographs: Aerial (Name & Date): SCDNR 2006, 99:11226:22; The aerials depict the tributary and adjacent wetlands as forested.
- or Other (Name & Date): Site photos provided by S&ME, Inc.
- Previous determination(s). File no. and date of response letter: SAC 2010-00600-4E; letter dated May 4, 2011.
- Applicable/supporting case law:.
- Applicable/supporting scientific literature:.
- Other information (please specify):.

B. ADDITIONAL COMMENTS TO SUPPORT JD: The off-site tributary was determined to have perennial flow based on the aerials, topographic map, and site visit. The aerials depict a linear feature indicative of a tributary and the topographic map depicts this tributary as a solid blue line, which usually indicates perennial flow. This tributary is an unnamed tributary of Maple Swamp. The site visit shows this tributary has indicators of perennial flow including a defined OHWM, a channel within bed and banks, a lack of leaf litter and debris in the channel, and flowing water observed. This pRPW receives flow upstream from a non-abutting wetland as well as a several non-jurisdictional ditches. This tributary flows into Maple Swamp, a pRPW, prior to flowing in to the Little Pee Dee River (a TNW). The non-abutting wetland on site, labeled Jurisdictional Wetland "R" on the plat, was determined to have a significant nexus to the off-site perennial RPW in Section III C above.
